

## **Global eBusiness Interoperability Test Bed (GITB) - Increasing speed and efficiency in eBusiness**

<http://www.ebusiness-testbed.eu/>

While eBusiness scenarios are more widely adopted, interoperability has become a major concern. More advanced testing methodologies and test beds are needed to support conformance and interoperability testing of comprehensive eBusiness specifications and their implementation by software vendors and end-users. The Global eBusiness Interoperability Test Bed initiative (GITB) develops methodologies and architectures that support e-business standards assessment and testing activities, from early stages of eBusiness standards development to implementation and deployment of large-scale eBusiness solutions. GITB is hosted by the European Committee for Standardization (CEN) and supported by European, North American and Asian partners, such as NIST, KorBIT, OASIS, OAGI and industry associations, such as AIAG (Automotive Industry Action Group).

GITB's long-term objective is to establish a shared and global testing platform which allows for plug-in testing capabilities (such as test suites, specialized validation components, message adapters, etc.). These testing capabilities can be supported by existing Test Beds, by remote services or by future test components to be developed. In order to capture e-business testing requirements and validate the approach, GITB closely works with user communities in eHealth (HL7), automotive (long-distance supply chains) and public procurement (PEPPOL).

We do look forward to getting your feedback on the GITB testing framework and your support in realizing GITB:

**Please download the GITB draft final report and send us your comments or any statements that support our work:**
